#### **Original Investigation**

### Implantable Cardioverter-Defibrillator Use Among Medicare Patients With Low Ejection Fraction After Acute Myocardial Infarction

Sean D. Pokomey, MD, MBA; Amy L. Miller, MD, PhD; Anita Y, Chen, MS; Laine Thomas, PhD; Gregg C. Fonarow, MD; James A. de Lemos, MD; Sana M. Al-Khatib, MD, MHS; Eric D. Peterson, MD, MPH; Tracy Y, Wang, MD, MHS, MSc

CONCLUSIONS AND RELEVANCE In this large registry study of older patients who experienced MI from 2007-2010, fewer than 1 in 10 eligible patients with low EF received an ICD within 1 year after MI, although ICD implantation was associated with lower risk-adjusted mortality at 2 years. Additional research is needed to determine evidence-based approaches to increase ICD implantation among eligible patients.

JAMA. 2015; 313:2433-40

### **NCDR: ICD Implant Age Distribution**

Epstein et al, Heart Rhythm 2009; 6:1136-43

## S-ICD

#### Pros:

- No intravascular/intracardiac leads
- No vascular access or related complications
- No endocarditis
- No downstream need for risky extraction

#### Cons:

- Multiple incisions
- Need for defib testing
- Greater need for anesthesia at implant
- No brady pacing
- No anti-tachy pacing
- No CRT
- Larger device
- Shorter battery longevity
- Higher cost

## Rate of Infection in ICDs and Pacers

3.0

2.5

2.0

1.5

1.0

0.5

Rate of CIED infection (%)

The reason for the increasing rate of CIED infection despite a decrease in overall device-related complications is not clear. One possibility for this observation includes the increasing numbers of ICD and cardiac resynchronization therapy devices whose longevity is significantly lower than PM. It is estimated that over 70% of ICD recipients will require device replacement surgery (19). Device replacement surgery is associated with an increased risk of infection (19,20). There may be an increasing burden of device replacements in the overall CIED population since ICDs now represent 35% of all implantations.

Greenspon et al, JACC 2011; 58:1001-6

## **Comparison of Age Distributions at Implant**

#### NCDR

#### **S-ICD IDE Trial**

#### Epstein et al, Heart Rhythm 2009

Courtesy: Boston Scientific Corp.

## S-ICD Implant

- Requires large incision/pocket + 1 or 2 more incisions
- Requires subcutaneous lead tunneling
- Requires defibrillation testing (unlike TV-ICD)
- Usually requires general anesthesia

# S-ICD vs TV-ICD Comparison

ATP	no	yes
Brady pacing	no	yes
Volume	59.5 cc	~30 cc
Longevity	7 yrs	10-12 yrs

How big is the need for pacing in this population?

#### NCDR Distribution of Devices – 1° Prevention (81%)

Epstein et al, Heart Rhythm 2009; 6:1136-43

#### NCDR Distribution of Devices – 2° Prevention (19%)

Epstein et al, Heart Rhythm 2009; 6:1136-43

### How many ICD pts are S-ICD suitable? 1345 TV-ICD pts without pacing indication at implant Age 60 ± 14

de Bie et al, Heart 2013; 99:1018-1023

How common are complications in S-ICD recipients?

### Combined S-ICD IDE + EFFORTLESS Trials

Other technical complications	5	5 (0.6	
Total	108	85 (9.6)	

#### Burke et al, JACC 2015; 65:1605-15

# Conclusions

- Elderly patients (≥ 70 yrs) comprise 42% of ICD recipients, but only 12% of S-ICD recipients.
- Roughly 20% of elderly transvenous ICD recipients get a singlechamber system implanted.
- True need for brady pacing or ATP in this population is uncertain.
- Over half of CEID infections occur in elderly patients, and associated mortality risk increases with age.
- S-ICD implants are not immune to infection, but treatment is simpler than for transvenous system.
- Relationship of S-ICD complications to age has not been studied.
- Choice of S-ICD in elderly should weigh advantage of nontransvenous access against need for brady pacing/ATP, larger device, and need for defib testing and anesthesia at implant.

Bogale et al, Eur J Heart Fail 2012; 14:61-73

# Conclusions

- CRT outcomes are similar in elderly and younger patients.
- LBBB prevalence increases with age, so CRT indications increase with age.
- But CRT utilization decreases with age.
- CRT-P (rather than CRT-D) is utilized more often in elderly than in younger patients, likely due to comorbidities and reluctance for ICD among the elderly.
